

Executive Privacy Guarantee:

Digitons Google Drive MCP operates on a **Zero-Persistence Architecture**. Your Google Drive files, document bodies, spreadsheets, presentations, and personal contents are **NEVER saved, written to disk, indexed, cached, or harvested** on our servers.

1. Overview & Operational Model

Digitons Google Drive MCP functions exclusively as a secure, ephemeral proxy between OpenAI ChatGPT / AI Agents and your authorized Google Drive account. When an AI tool reads or searches a document at your command, data streams directly through volatile runtime memory (RAM) via encrypted HTTPS/TLS and is immediately discarded from memory once forwarded to your active chat session.

2. Architectural Security Controls

 **1. Strict Multi-User Isolation**

Every user links their own Google Account. There are **no shared credentials** or master service accounts. User A cannot view, discover, or modify User B's files under any scenario.

 **2. Zero File Retention on Server**

Drive files are streamed strictly in-memory during active tool calls. No files, metadata caches, or full-text indexes ever touch persistent storage on our servers.

 **3. POSIX-Restricted Credential Store**

OAuth session tokens are saved in restricted directories with strict operating system POSIX permissions: directory mode `0700` and storage files `0600` (owner process only).

 **4. Cryptographic PKCE & Anti-Replay**

Built on standard OAuth 2.0 with **PKCE S256** (RFC 7636). One-time link tokens expire in 10 minutes, are stored exclusively as one-way SHA-256 hashes, and are destroyed atomically after first use.

3. Total User Control & Instant Revocation

Users maintain absolute ownership and control over their Google account credentials at all times:

Two Instant Methods to Disconnect & Purge Data:

1. **Direct Disconnect in ChatGPT:** Asking to disconnect triggers an automated disconnect call (POST /auth/google/disconnect), which instantly revokes tokens with Google and wipes all local credentials from the server.
2. **Via Google Account Settings:** You can instantly revoke permissions at any time from your Google Dashboard at myaccount.google.com/permissions.

4. Transparent Data Classification Matrix

A full, transparent audit of how user data is handled by the Digitons platform:

Data Category	On Server?	Retention Period	Handling & Security Method
Google Drive Files & Content (Docs, Sheets, PDFs, text, etc.)	NO	0 seconds (RAM only)	Streamed transiently in-memory directly from Google API to the active MCP session. Never saved to disk.
OAuth Access & Refresh Tokens	YES (Isolated)	Until disconnected	Used strictly to make authorized Google API calls on your behalf. Guarded by OS mode 0600 file restrictions.
User Account Email & Name	YES (Basic)	Until disconnected	Retrieved from Google UserInfo endpoint solely to confirm connection status to the user.
One-Time Connection Tokens	NO (Hash Only)	Max 10 minutes	Only SHA-256 cryptographic hashes are kept. Permanently destroyed upon first use or expiration.
Audit & System Logs	YES (Sanitized)	Rolling retention	Operational metrics only. All tokens, keys, and authorization codes are automatically redacted ([REDACTED]).
AI Model Training	NEVER	N/A	Digitons does not train, fine-tune, or adapt AI models on your files or personal data.

5. Logging Sanitization & Audit Integrity

The server implements continuous deep-sanitization across all loggers. Confidential values are intercepted and replaced with [REDACTED] prior to output:

- Google access tokens, refresh tokens, and client secrets are stripped from log records.
- MCP Bearer tokens, state parameters, and authorization codes are completely masked.
- No access tokens or secrets are ever exposed in URLs, query parameters, or client redirects.

6. Compliance & Industry Standards

- Google API Services User Data Policy:** Digitons strictly complies with Google's Limited Use requirements. Data received from Google APIs is never used for advertising, nor shared with unauthorized parties.
- Transport Layer Security:** All client and API communication requires TLS 1.3 / HTTPS encryption.
- Model Context Protocol (MCP) Standard:** Adheres to open MCP specifications with explicit tool safety hints (annotating read-only vs. destructive actions).
